1. Introduction

Zomato is one of the world's most popular food delivery and restaurant discovery platforms. This case study evaluates the user experience of the Zomato mobile app and identifies opportunities to improve efficiency, usability, and customer satisfaction.

3. UX Strengths

Simple Navigation

The bottom navigation bar makes it easy for users to switch between Home, Search, Orders, and Profile.

Strong Visual Hierarchy

Restaurant cards display ratings, delivery time, offers, and images in a scannable format.

Real-Time Delivery Tracking

Live order updates reduce anxiety and improve user trust.

Personalized Recommendations

Users receive restaurant suggestions based on previous interactions and location.

Impact of Strengths

These strengths contribute to higher user engagement, reduced cognitive effort, and a smoother food-ordering experience. The platform successfully guides users from discovery to checkout with minimal confusion.

4. UX Weaknesses

Choice Overload

Users are often presented with too many restaurants and promotions, making decision-making difficult.

Complex Filters

The filtering experience contains numerous options that can overwhelm first-time users.

Promotional Clutter

Large numbers of banners and offers compete for attention on the home screen.

Repeated Checkout Steps

Returning customers must often repeat actions that could be automated.

5. Proposed UX Improvements

Improvement 1: AI-Powered Meal Suggestions

Introduce a recommendation engine that suggests meals based on previous orders, budget, location, and time of day. This would reduce decision fatigue and help users discover relevant options faster.

Improvement 2: Smart Quick Filters

Replace the traditional filter menu with quick-access chips such as Top Rated, Healthy, Fast Delivery, Budget Friendly, and Near Me. This improves accessibility and reduces the number of interactions required.

Improvement 3: One-Tap Reorder

Allow users to instantly reorder previously purchased meals from a dedicated Order Again section. This improves convenience and encourages repeat purchases.

6. Expected Outcomes

The proposed improvements are expected to reduce the time required to place an order, improve customer satisfaction, increase retention rates, and boost conversion rates. Personalized recommendations and streamlined navigation can significantly enhance the overall user experience.

7. Conclusion

Zomato already delivers a strong food-ordering experience through intuitive navigation, real-time tracking, and personalized content. However, opportunities remain to simplify discovery, reduce visual clutter, and accelerate repeat purchases. By implementing AI-powered recommendations, smart filtering, and one-tap reorder functionality, Zomato can create a more efficient, engaging, and user-centered experience while achieving measurable business benefits.

Key Takeaway: The best food delivery experience is not about offering more choices—it is about helping users make the right choice faster.
